

King Fahd University of Petroleum & Minerals
Department of Mathematics
Math 333 Major Exam I
The Third Semester of 2021-2022 (213)

Time Allowed: 90 Minutes

Name: Key ID#: _____
Section/Instructor: _____ Serial #: _____

- Mobiles, calculators and smart devices are not allowed in this exam.
 - Write neatly and legibly. You may lose points for messy work.
 - Show all your work. No points for answers without justification.
-

3		16
4		12
5		16
6		20
7		16
Total		100

Q:1 (08 + 04 points) (a) Find the parametric equations of the tangent line of the vector function $\mathbf{r}(t) = \langle t^2, 2 \sin(t), 2 \cos(t) \rangle$ at $t = \frac{\pi}{3}$.

$$\mathbf{r}'(t) = \langle 2t, 2 \cos t, -2 \sin t \rangle \quad] \quad \textcircled{3}$$

$$\mathbf{r}'\left(\frac{\pi}{3}\right) = \langle \frac{2\pi}{3}, 1, -\sqrt{3} \rangle$$

$$\mathbf{r}\left(\frac{\pi}{3}\right) = \langle \frac{\pi^2}{9}, \sqrt{3}, 1 \rangle \quad \textcircled{2}$$

Parametric equations of tangent line are

$$x = \frac{\pi^2}{9} + \frac{2\pi}{3}t \quad \textcircled{3}$$

$$y = \sqrt{3} + t$$

$$z = 1 - \sqrt{3}t$$

(b) Find all points on the graph of $f(x, y) = xy$, where $D_{\hat{u}}f(x, y) = \sqrt{5}$, $\mathbf{u} = \langle 1, 2 \rangle$.

$$\nabla f = \langle y, x \rangle \quad \textcircled{1}$$

$$\hat{\mathbf{u}} = \frac{\langle 1, 2 \rangle}{\sqrt{5}} \quad \textcircled{1}$$

$$D_{\hat{\mathbf{u}}}f = \nabla f \cdot \hat{\mathbf{u}}$$

$$\sqrt{5} = \frac{y+2x}{\sqrt{5}} \quad \textcircled{1}$$

$$\Rightarrow y+2x=5 \quad \textcircled{1}$$

$$\text{Set of points} = \{ (x, y, z) : y+2x-5=0 \}$$

Q:2 (8 points) Evaluate $\int_C x^2 y ds$ on the lower half circle $x^2 + y^2 = 4$ oriented counter-clockwise ($\pi < \theta < 2\pi$).

$$x = 2 \cos t \quad \Rightarrow \quad dx = -2 \sin t dt \quad (2)$$

$$y = 2 \sin t \quad \Rightarrow \quad dy = 2 \cos t dt$$

$$\int_C x^2 y ds = \int_{\pi}^{2\pi} (2 \cos t)^2 (2 \sin t) \sqrt{4 \sin^2 t + 4 \cos^2 t} dt \quad (2)$$

$$= \int_{\pi}^{2\pi} 2^4 \cos^2 t \sin t dt \quad (1)$$

$$= 16 \int_{-1}^1 -u^2 du \quad (1)$$

$$= -16 \left[\frac{u^3}{3} \right]_{-1}^1 \quad (1)$$

$$= -16 \left[\frac{1}{3} + \frac{1}{3} \right] = -\frac{32}{3} \quad (1)$$

$$\text{Let } \cos t = u \\ -\sin t dt = du$$

Q:3 (16 points) Consider the vector field $\mathbf{F} = \langle yz, xz + 2y, xy + 1 \rangle$ on a certain region of space.

(a) Verify that \mathbf{F} is a conservative vector field.

(b) Find a potential function for \mathbf{F} .

$$\vec{\nabla} \times \vec{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ yz & xz + 2y & xy + 1 \end{vmatrix} \quad (3)$$

$$= \langle x - x, -(y - y), z - z \rangle = \mathbf{0} \quad (3)$$

Therefore, the vector field \vec{F} is conservative. For the potential

$$u(x, y, z) = \int P(x, y, z) dx + G(y, z) = \int yz dx + G(y, z) \quad (2)$$

$$= xyz + G(y, z) \quad (1)$$

$$\frac{\partial u}{\partial y} = xz + G'_y(y, z) = xz + 2y \quad (1)$$

$$\Rightarrow G'_y(y, z) = 2y \quad (1)$$

$$\Rightarrow G(y, z) = \int 2y dy + H(z)$$

$$= y^2 + H(z) \quad (1)$$

Hence $u(x, y, z) = xyz + y^2 + H(z) \quad (1)$

$$\frac{\partial u}{\partial z} = xy + H'(z) = xy + 1 \quad (1)$$

$$\Rightarrow H'(z) = 1 \quad (1)$$

$$\Rightarrow H(z) = z + C \quad (1)$$

$$\Rightarrow u(x, y, z) = xyz + y^2 + z + C. \quad (1)$$

Q:4 (12 points) Use Green's theorem to evaluate $\iint_D y^2 dx dy$, where

$$D = \{(x, y) \in \mathbb{R}^2 : \frac{x^2}{4} + y^2 \leq 1\}.$$

(Hint: Consider $P = 0$, $Q = xy^2$ and parametrize the curve.)

$$P = 0, \quad Q = xy^2 \quad (2)$$

$$\frac{\partial P}{\partial y} = 0, \quad \frac{\partial Q}{\partial x} = y^2$$

Green's theorem

$$\iint_D y^2 dx dy = \iint_D \left(\frac{\partial Q}{\partial x} - \frac{\partial P}{\partial y} \right) dx dy \quad (2)$$

$$= \oint_C P dx + Q dy \quad (2)$$

$$= \oint_C xy^2 dy \quad (2)$$

$$C: \frac{x^2}{4} + y^2 \leq 1 \Rightarrow x = 2 \cos t, \quad y = \sin t$$

$$\therefore I = \int_0^{2\pi} 2 \cos t \cdot \sin^2 t \cdot \cos t dt = 2 \int_0^{2\pi} \cos^2 t \cdot \sin^2 t dt \quad (2)$$

Having in mind that $\sin 2t = 2 \sin t \cos t$, we get

$$I = \frac{1}{2} \int_0^{2\pi} \sin^2 2t dt = \frac{1}{4} \int_0^{2\pi} (1 - \cos 4t) dt \quad (2)$$

$$= \frac{1}{4} \left[t - \frac{\sin 4t}{4} \right]_0^{2\pi}$$

$$= \frac{\pi}{2} \quad (2)$$

Q:5 (16 points) Find the surface area of the part of the sphere $x^2 + y^2 + z^2 = 25$, where $x^2 + y^2 \leq 16$ and $z \geq 0$.

$$z = f(x, y) = \sqrt{25 - x^2 - y^2}$$

$$f_x = \frac{-x}{\sqrt{25 - x^2 - y^2}}, \quad f_y = \frac{-y}{\sqrt{25 - x^2 - y^2}} \quad (4)$$

$$\text{Surface area} = \iint_R \sqrt{1 + \left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2} dA \quad (2)$$

$$= \iint_R \frac{5}{\sqrt{25 - x^2 - y^2}} dA \quad (2)$$

Let $x = r \cos \theta$, $y = r \sin \theta$, $0 \leq r \leq 4$.

$$\text{Surface area} = \int_{\theta=0}^{2\pi} \int_{r=0}^4 \frac{5}{\sqrt{25 - r^2}} \cdot r dr d\theta \quad (2) + (2)$$

$$= 10\pi \int_0^4 \frac{r dr}{\sqrt{25 - r^2}} \quad (1)$$

$$= -10\pi \sqrt{25 - r^2} \Big|_0^4 \quad (2)$$

$$= 20\pi \quad (1)$$

Q:6 (20 points) Verify Stokes' theorem $\mathbf{F} = \langle 3y, -xz, yz^2 \rangle$, where S is the surface of the paraboloid $2z = x^2 + y^2$ bounded by $z = 2$. (orient C to be counterclockwise when viewed from above)

Parametrization of $x^2 + y^2 = 4$.

$$x = 2 \cos t, y = 2 \sin t, z = 2; 0 \leq t \leq 2\pi$$

$$\begin{aligned} \oint_C \mathbf{F} \cdot d\mathbf{r} &= \oint_C 3y dx - xz dy + yz^2 dz \\ &= \int_0^{2\pi} 3(2 \sin t)(-2 \sin t) dt - (2 \cos t)(2)(2 \cos t) dt + 0 \\ &= -\int_0^{2\pi} (12 \sin^2 t + 8 \cos^2 t) dt \\ &= -20\pi \end{aligned}$$

$$\vec{\nabla} \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ 3y & -xz & yz^2 \end{vmatrix} = \langle z^2 + x, 0 - 0, -z - 3 \rangle$$

$$\hat{n} = -\frac{\nabla(x^2 + y^2 - 2z)}{|\nabla(x^2 + y^2 - 2z)|} = -\frac{\langle x, y, -1 \rangle}{\sqrt{x^2 + y^2 + 1}}$$

$$\begin{aligned} \text{Therefore, } \iint_S (\vec{\nabla} \times \mathbf{F}) \cdot \hat{n} dS &= \iint_R \vec{\nabla} \times \mathbf{F} \cdot \hat{n} \frac{dx dy}{|\hat{n} \cdot \mathbf{k}|} \\ &= -\iint_R (xz^2 + x^2 + z + 3) dx dy \\ &= -\iint_R x \left(\frac{x^2 + y^2}{2} \right)^2 + x^2 + \frac{x^2 + y^2}{2} + 3 dx dy \\ &= -\int_0^{2\pi} \int_0^2 \left[(r \cos \theta) \left(\frac{r^2}{4} \right) + r^2 \cos^2 \theta + \frac{r^2}{2} + 3 \right] r dr d\theta \\ &= -20\pi \end{aligned}$$

Q:7 (16 points) Use the divergence theorem to evaluate $\int_S (\mathbf{F} \cdot \mathbf{n}) dS$, where

$\mathbf{F}(x, y, z) = \langle y, x, z^2 \rangle$ and D is the region in R^3 bounded by the paraboloid $z = x^2 + y^2$ and the plane $z = 1$.

$$\nabla \cdot \vec{F} = 0 + 0 + 2z \quad (2)$$

Divergence theorem $\int_S \vec{F} \cdot \vec{n} dS = \int_D \int \int \nabla \cdot \vec{F} dV \quad (2)$

$$= \int_D \int \int 2z dV$$

$$= \int_{\theta=0}^{2\pi} \int_{r=0}^1 \int_{r^2}^1 2z dz \cdot r dr d\theta \quad (3) + (3)$$

$$= 2\pi \int_0^1 (1-r^4) \cdot r dr \quad (1) + (1)$$

$$= 2\pi \left[\frac{r^2}{2} - \frac{r^6}{6} \right]_0^1 \quad (2)$$

$$= 2\pi \left[\frac{1}{2} - \frac{1}{6} \right] \quad (2)$$

$$= \frac{2\pi}{3}$$
